Dear Hiring Team,

I am applying for AI application / LLM product engineering roles that need someone who ships agents and retrieval products, not research papers. My work centers on applied tooling: MCP servers, RAG prototypes, and agent-facing systems that real people and agents can operate.

At OSBR I designed and prototyped a travel-client AI/RAG conversational experience (UX, mock-ups, and frontend integration) and built an internal Next.js AI chatbot for the same engagement. Independently I am shipping Kaeru, a desktop AI workspace for non-developers, log.exe, an Agentic CMS with MCP/CLI/Ask doors on Cloudflare D1+R2, and Canopy, a multi-agent debate viewer with a human approval gate.

I am looking for a team where LLM features are product work: reliability, cost, and speed-to-ship matter as much as model choice. I would welcome a conversation about how I can help ship your next applied AI surface.

Sincerely,
Amirah Nasihah
